Weston Winery & Vineyards ..... E-8

**Tasting Room**

Bitner Vineyards ..... E-8
Davis Creek Cellars ..... E-8
Snake River Winery Tasting Room ..... F-8

## About Snake River Valley

**Snake River Valley Background**

Snake River Valley American Viticultural Area (AVA) was approved in April 2007, encompassing 8,600 square miles with 1,600 vineyard acres currently planted. The Snake River Valley AVA overlays the Ancient Lake Idaho and the shoreline of this now extinct lake creates its natural boundaries.

Vineyards within the AVA have in common:

Soil – Lake bottom sediments and volcanic remnants. These well draining soils give growers control over the growth of the grapevine.

Climate - intense summer growing season with 16 hours of sunlight.
Daytime temps in the 90s and nighttime temps in the 50s. Daytime temps lend themselves to ripe, fruit-forward wines, cool night temps conserve tannins and acid, providing wines with great structure.

Water – Directly below the originating watersheds of the Rocky Mountains. The proximity to water gives us potential to have sustainable vineyards for generations to come.

The Snake River Valley AVA has good company with the great growing regions of the world in terms of latitude, elevation and growing season. Climate conditions are very similar to AVAs in the Columbia Valley in Washington State. Elevations (1,500-3,000ft), are comparable to those in the high mountain deserts of the famed Rioja region in Spain. While latitudes of the Snake River Valley AVA range from 42° to 44°, similar to those of the Southern Rhone in France.

**History of Snake River Geology**

Fire, Water & Floods… The boundaries of the Snake River Valley Viticultural Area are those of the shoreline of Ancient Lake Idaho (about 2,400 feet), which formed 5 million years ago as the crust sagged and was filled with water from the surrounding rivers. This valley saw volcanic activity throughout the time it was submerged, while water continued to shape its destiny, carving a way out the Columbia River basin through Hells Canyon. Meanwhile further south…at the end of the last ice age, the Great Salt Lake was 1000 feet deep and many times its current size. Called Lake Bonneville, it broke through Red Rock Pass in Southeastern Idaho and drained in a cataclysmic flood that both deepened the Snake River Canyon and covered other areas of the valley in sediments. As you travel through the valley you will see evidence of the thick deposits of sediments along with remnants of volcanic cinder cones, lava flows and the erosive power of the rivers and floods. All of these processes, combined with an ideal climate and deep human creativity have helped create the unique terroir of the Snake River Valley American Viticultural Area.
